รหัสและชื่อรายวิชา Course Code and Course Title 2302103(ภาษาไทย)
การเป็นผู้ประกอบการที่ยังยืนและรับผิดชอบต่อสังคม
(English) Sustainable and Responsible Entrepreneurship

Introduction

- We will start with the Ontological Question - what is critical thinking and how it should be applied into your business

Why do we need to start with Ontological Questions?

- Because we are (Being) graduate students.
- And to be like that, we need to have a Basic Philosophy.

  To see the importance (Necessity and its Essence) of being.
- On the basis of being, we will move on towards our Topic that is the Meaning of Entrepreneurial Leadership : Critical thinking and managerial decision

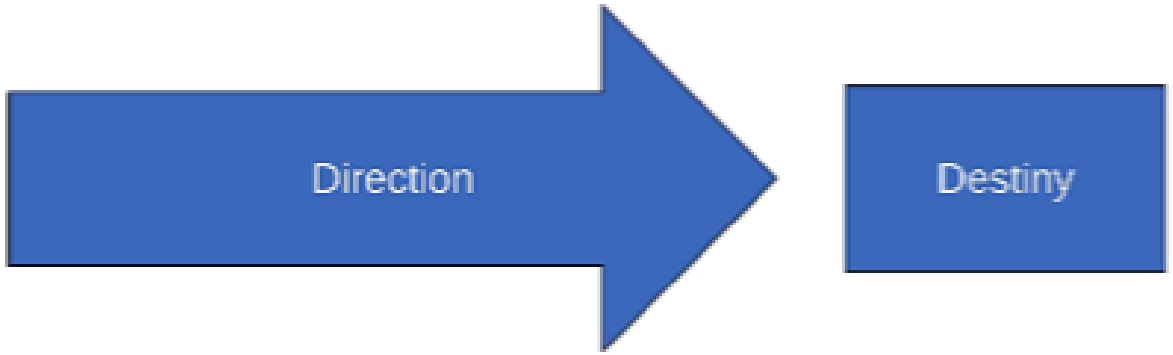

Our move on will be on Track and have Directio

- Because we understand the Basic Philosophy that has the following knowledge base : Ontology - Ontology - Philosophy of Being (Definition)
- Epistemology - Theory of Knowledge - Characteristics of Being (Being Qualities)

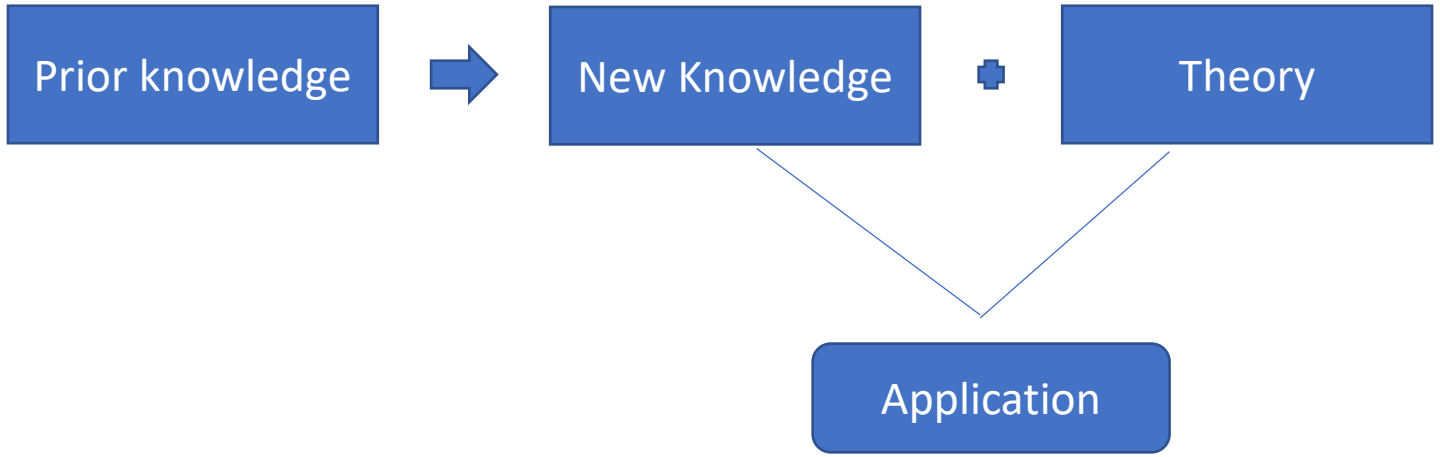

Ethic - Ethics - Implementation into practice that is consistent with Being

On understanding, on a philosophical basis (Basic Philosoph

- We Move On
- Point of Departure

Parallel to this

On this basis

On this basis,

- Let's start by defining - what is Critical Thinking?

With the objectives

1. Understand the importance of Critical thinking and the process of critical thinking step by step
2. Learn techniques and methods to develop Critical Thinking skills
3. Learn how to apply Critical Thinking

English Definitions

- the act or practice of thinking critically (as by applying reason and questioning assumptions) in order to solve problems, evaluate information, discern biases, etc. (Merriam-Webster)
- Critical thinking is the process of analyzing available facts, evidence, observations, and arguments to make sound conclusions or informed choices. It involves recognizing underlying assumptions, providing justifications for ideas and actions, evaluating these justifications through comparisons with varying perspectives, and assessing their rationality and potential consequences (Brookfield, Stephen D. (1987))

• Critical thinking is the intellectually disciplined process of actively and skillfully conceptualizing, applying, analyzing, synthesizing, and/or evaluating information gathered from, or generated by, observation, experience, reflection, reasoning, or communication, as a guide to belief and action. In its exemplary form, it is based on universal intellectual values that transcend subject matter divisions: clarity, accuracy, precision, consistency, relevance, sound evidence, good reasons, depth, breadth, and fairness(Michael Scriven & Richard Paul, 1987).

Meaning of Thai language

- Critical thinking, which is one of the 4 Cs of thinking:

Communication, Collaboration, Creativity and Critical Thinkingis essential for people working in this era. We can see that in an era of a lot of news, a lot of scammers, fraudulent investments such as Forex withunrealistically good returns, and a lot of fake news,critical thinking skills are essential skills that everyone must have in order to consider information from all sides give reasons, and then decide to act or induce something. In other words, critical thinking means the process of critical thinkingby using judgment or making decisions with reason in all aspects, using reason to analyze issues,including collecting information from all sides, exploring other elements that may influence the conclusion in order to examine, consider, judge and evaluate the correctness or issues at that time accurately (Sasimas Suksawang)

Critical Thinking is called in Thai as *การคิดเชิงวิพากษ์" or

"การคิดอย่างมีวิจารณญาณ,"which means the ability to analyze and

evaluate information critically. It refers to the intention to carefully consider and decide on an issue by not blindly acceptingpresented claims but instead questioning or challenging them to seek more reasonable and logical conclusions than the original claims.(Source: Learning Institute, Phra Nakhon Si Ayutthaya Technology College)

Critical Thinking or "การคิดเชิงวิพากษ์"

refers to the ability to think logically and rationally based on reasoning and evidence. It does not rely on mere beliefs, experiences, or past knowledge in decision-making.Instead, it involves understanding causes

and effects that can be logically connected to different ideas, leading to more accurate or improved answers and decisions.(Source: Code Genius Institute)

Additionally, Sartika

- stated that analytical thinking is the relationship between facts, reasoning, and data reactions. It involves breaking down data and facts into separate issues, carefully evaluating them to derive an answer or conclusion.

Summary

- Critical thinking is a thought process that involves behavior, inquiry components, situational analysis, and outcomes.

It is essential when situations are unclear and require individuals to identify or predict issues to find solutions using reasoning. The key component of problem-solving is critical thinking, which requires careful consideration, supporting reasoning, conceptual thinking, and skills to analyze, synthesize, and evaluate information to derive an answer or conclusion.Critical thinking is associated with questioning attitudes and the ability to manage problems effectively, both positivelyand negatively.

From the above discussion

- What does critical thinking mean for students?

Concept, Theory, and Critical Analysis

- Critical analysis originates from Aristotle's ideas, ho preferred reasoned arguments as they involve examining and answering questions from diverse perspectives. Argumentation through reasoning is an optimistic approach, assuming that better ideas always exist to improve society.Examining ideas through opposing viewpoints is highly effective (Nelson, Palonsky, and McCarthy, 2007, cited in Pruet Siribunphitak, 2010:3).

- This concept is supported

- by Roth (1989) (cited in Pruet Siribunphitak, 2010:3), who observed that reasoned argumentation in education leads to enlightenment regarding teacher and societal development.

- In the book Philosophy and Education by Banchong Jantarasa (1979),

critical analysis is described as identifying key issues and arguments, analyzing main ideas, and reasoning from different perspectives

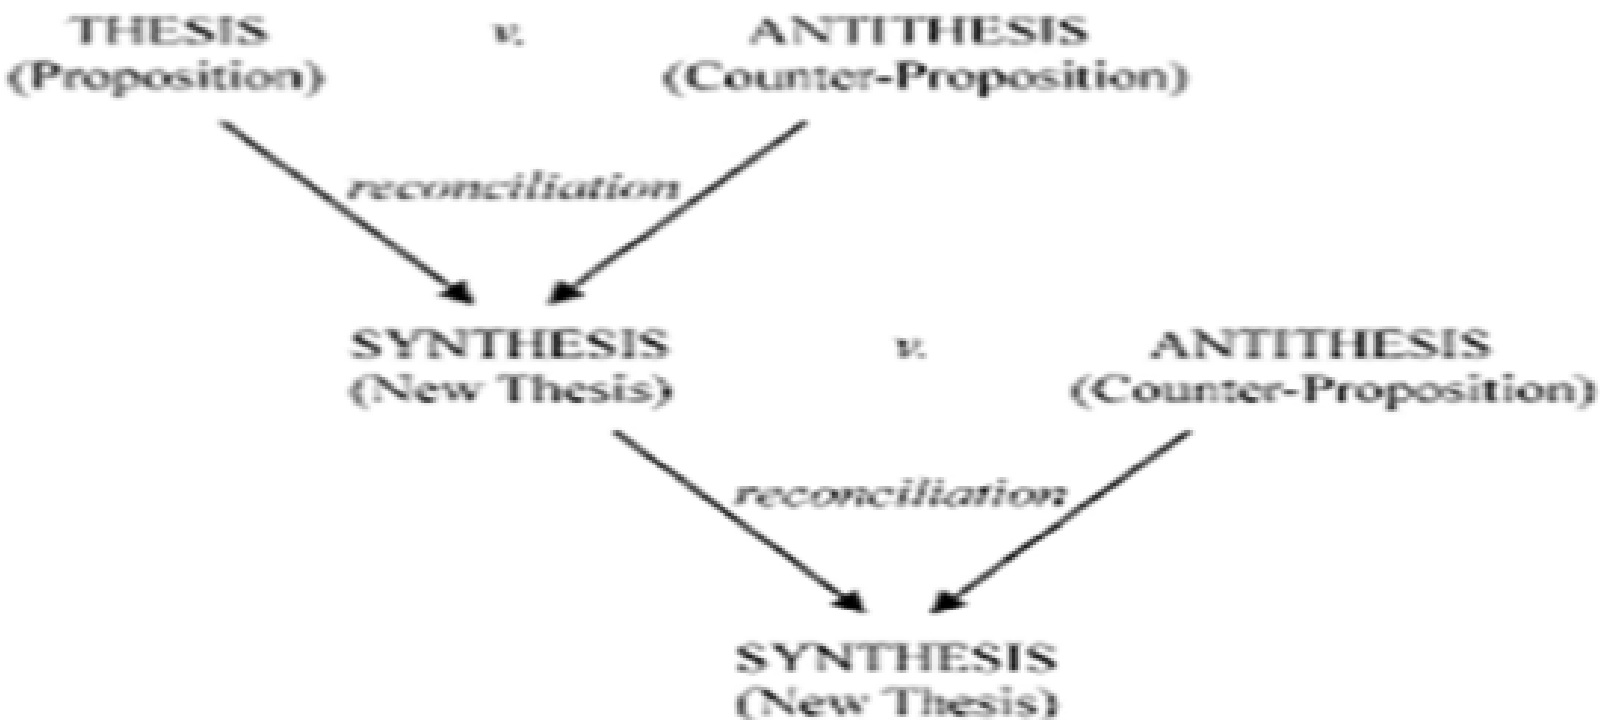

• Hegel (Spensor and Krauze, 1997, cited in Phrut Siribanpitak, -2010:-4) has used the dialectical process to explain the characteristics of the movement

of the mind and the conflict of the mind proceeds in a cycle of basic states (thesis), conflict states (antithesis), and reconciliation states(synthesis).

When a new opinion arises, this new thought will conflict with the opinion in the basic state (antithesis).After the two opinions conflict with each other by reason, there will be a conclusion where one side will surrender.

• In this state, there will be a compromise or a synthesis state (synthesis).

As a result of this compromise, a new basic state (new thesis) will arise. After that, there will be conflict, compromise, and entering into a new basic state. This continues endlessly until reaching perfection.

THESIS
(Proposition)
v.
ANTITHESIS
(Counter-Proposition)
reconciliation
SYNTHESIS
(New Thesis)
v.
ANTITHESIS
(Counter-Proposition)
reconciliation
SYNTHESIS
(New Thesis)

From Figure 1, it shows the process of change that occurs in the human mind in the initial stage. The mind is in a state of satisfaction with the state of truth, as it is at present (thesis state). For example, in the present state, we think that humans should live foronly. They should live for others as well. When there is aconflicting thought that conflicts with the original thought(antithesis state), when such a conflict occurs, both sides will find reasons to refute each other in order to obtain what is true or most correct. In the end, one side's thought will win or find a compromise (synthesis state). They may agree that from now on, we will live for others and society as a whole. When we reach this point, we will be in a state of satisfaction with the newly acquired thought (i.e., practicing for others). This state will become a newthesis (like a new starting point).

- But when practicing for others for a while, there may be a conflicting thought (antithesis) that the action is not the best thing. It would be better to do it for oneself as well as for others as appropriate. This conflicting thought will lead to another compromise (synthesis) and a new starting point will arise again . It will continue like this for as long as the human mind is still working. It will find the highest truth (absolute truth) or until there is awareness of the highest truth.

- Therefore, critical analysis is thinking. Critical analysis that uses the synthetic thinking style (synthesis) which is interested in change by looking for opposing opinions and synthesis or synthesis (Harrison and Branson, 1982 cited in Parit Siri Banpitak,2010: 29)

Bloom's learning process concept and critical thinking

• Learning theory according to Bloom's taxonomy Bloom (Bloom, 1976) stated that for successful and effective teaching and learning, teachers must clearly define the objectives so that teachers can determine and organize learning activities and assess and evaluate correctly at the same time. The concept of teaching and learning that focuses on learners, which has an important goal of developing learners to have the potential to develop critical thinking skills, is very important in teaching and learning according to the reform approach that aims to develop people to be able to think, do, and solve problems.

Key Characteristics of Critical Thinking

- Demonstrates complexity, logical reasoning, structured and detailed thought, and responsibility in decision-making

- Bloom's taxonomy divides learning into three domains:

1. Cognitive domain
2. Affective domain
3. Psychomotor domain Each domain classifies abilities from lowest to highest levels:

- Cognitive domain progresses from: • Knowledge • Understanding • Application • Analysis • Synthesis • Evaluation

Bloom (Blaom,-1976) divides the level of learning knowledge into 6 levels, all of which may occur simultaneously (Piriyalak Sirisuphalak , 2013: 8) as follows.

- 1. Memory knowledge (Knowledge) refers to the ability to remember various knowledge that has been learned as the ultimate function of the brain. Emotion and attention affect memory, concentration, learning, intelligence and brain function by focusing.
- Asking questions
- Who does what?
- Show details and pulleys, relationships, lock, classify, tell features, tell

- 2. Understanding (Comprehension) refers to the ability

to translate expand, and understand what has been learned,

which focuses on the question, why, explain, describe, separate,

 summarize, such as to interpret, change, show, give examples,

explain, translate, translate, summarize, report, describe

and define the scope, etc.
