• 3. Application (Application) means the ability to use what has been learned. The edge of the brain, focusing on questions to solve the problem of celebrating, trading, and trading. Examinations or discoveries such as applying, re-organizing, solving grouping problems and used in choosing outlines, training, etc.

• 4. Analysis (Analysis) refers to the ability to separate knowledge into parts and then understand how each part is related and different, focusing on comparing similarities or differences, such as classifying, grouping, comparing, summarizing, explaining, analyzing , separating, testing, exploring, questioning, examining, discussing similarities or finding pros and cons, etc.

• 5. Synthesis (Synthesis) refers to the ability to combine various knowledge into something new as a new thinking. Invent new things But often closed by thoughts Fears or original experiences Synthesis is caused by stimulation . Able to challenge the level of the level. Emphasize the nouns that can be given. Try nine secondary words which Invention, design, etc.

• 6. Evaluation (Evaluation) refers to the ability to judge the value rationally. It is the brain's work to evaluate the situation and decide what to do, such as setting the price, judging the value, considering to summarize the weighting, setting criteria, comparing, correcting and scoring, etc

From the steps of applying critical thinking to practice

- Let students summarize what critical thinking is and apply this understanding to problem solving by setting up a simulation situation that students need to enter andevaluate the situation.

From this understanding, let's study more
about the elements of critical thinking.
What elements of critical thinking are divided into 4 sub-components:

1. Thinking around the computer and having a goal . Prudence means trying to think slowly so that the decision or goal is possible. Correctly or appropriately in each situation

2. The use of reason or logic that comes in Reasoning means checking information related to options or information related to the problem.

3. Cutting about faith Decision-making means consideration based on reliable information.

4. Application to the problem Misunderstanding of the word critical thinking consists of critical thinking as an idea. Negative can occur naturally. Critical thoughts are not related to knowledge. The experience of the critic and critical thinking must occur throughout life.

(Bangkok Bureaucracy Development Division 2021)

Sasima Suksawang said

The main elements of critical thinking (Critical Thinking element) are as follows.

1. Logical reasoning (Logical reasoning)

2. Information Linkage (Information Linkage)

3. Systematic problem solving (Structured problem solving)

4. Understanding biases (Understanding biases)

5. Decision making (Decision making)

6. Thinking new things and curiosity (Creativity & Curiosity)

As Wipawee Thiralila (2021)

1. Clearly define the question, problem, or issue of interest.
2. Gather information to help weigh it as an option for decision-making.
3. Analyze the information through asking the right questions.
4. Consider the impact of what you are about to decide to do.
5. Explore the perspectives and opinions of others.

Critical thinking (Critical thinking) has the following chapters.

1. Ask a question (Formulate your Question) When any event occurs, look at another angle that is different from the original or question that event. The events that we

should criticize before concluding are as follows.

2. It is a generally accepted assumption, but we have doubts. Do not believe or not accept because humans usually tend to believe without questioning what is accustomed in the same culture, system, tradition. For example, humans believethat our world is flat or men are front-footed elephants, women are hind-footed elephants.

3. Opinions or conclusions with reasons to be verified. Usually the presentation of comments The reason for the main reason is that it is true or not. Is it consistent and reasonable with the comments and conclusions?

4. Proposals or choices that need to be considered before making a decision. It may be small things such as choosing the food that we will eat each day. Whether choosing only delicious fod or need to have complete nutritional value To matters with a large amount of information or complexity Therefore, before making a decision, we should criticize, consider,find information be a complete reason for all aspects.

5. Problems that we need to solve or decide often unexpected events that need to find the most appropriate way to fix or decide how to fix it.

6. Gather your information (Gather your information)when there are assumptions or any questions that are clear. Take action to get to know the supporting information in all aspects. Which may be research from textbooks, research or reliable experts

7. In the middle of the line, the actual medicine between the ankles, opinions, or a little information from Before synthesizing as an option.

8. Consider the conditions (Consider the implications) Consider the impact of choices or decision-making in all aspects, the pros and cons that occur, such as choosing to use electric cars. Although it helpsreduce road pollution more than combustion cars, but what are the disadvantages that occur with electric cars?

9. Explore other points of view (Explore other points of view) Try to consider other options, especially conflicting options or on the opposite side, what are the impact, what are the advantages and disadvantages, or will raise questions about the chosen options so that we can consider as fully as possible or can develop better options (King Mongkut's University of Technology Thonburi, 2024)

Elements of Critical Thinking Skills
Can be divided into 3 sub-skills as follows:

1. True information using logic and logical principles or as Conclusively, the conclusion is true based on a true proposition or assessment.

2. Inductive inference is a general summary of the results from

3. Statistical inference (statistical inference) is a

general summary of the results from statistical sample data with a certain level of uncertainty.

While the Human Soft training company has mentioned the important elements of Critical Thinking.

1. Logical reasoning Critical thinking requires all-round analytical thinking, both positive and negative, leading to systematic decision-making. to cuson using reason rather than using emotions make decisions or solve problems. By relying on logical conclusions, there must be data, facts to dentify weaknesses or strengths of things, which must have the ability to draw logical conclusions based on facts, all-round information or arguments to identify the strengths and weaknesses of those arguments.
2. Linking data, data analysis, there are often many relevant information. Therefore, we should have critical thinking to use in analyzing data and factssthat are necessary to summarize the results. Can bring data to link and then bring those data to evaluate
3. Systematic problem solving Another important element of Critical Thinking is the ability to solve difficult and complex problems. This critical thinking must be able to separate the problem into parts. Identify the true cause of each problem. Can find a solution The problem appropriately according to each situation
4. To understand human prejudice, we should have an understanding of emotional prejudice, which affects the analysis of our own and others' problems. Understanding this bias will influence the process of thinking, distinguishing and analyzing our humans.
5. Critical thinking decisions will have a positive effect on decision-making. Because if we can think, analyze and distinguish the problems that arise by analyzing, collecting information systematically for rational decision-making. By using consciousnessinstead of using emotions,it will allow us to make accurate decisions. No mistakes or may occur as little as possible
6. Dare to think outside the box in critical thinking, in addition to having to analyze the reason and collect information effectively. We should have aw way of thinking. Think outside the box. Of course, new thinking will make a difference. Which has a positive effect on the organization for sure

And LIFEstudies.net has identified the elements of Critical Thinking that

1. Get information, don't jump to conclusions... Interpret it clearly. We have to learn to look at things "according to tradition" or

"Look at what you see as it is" to know what uangnan is about, don't jump to conclusions or express any views about Ruangnan. It is an expression of desire to investigate that girl on a deeper level than before by trying to understand.

Find the source of that.

2If there is a problem, don't solve it quickly... Check for sure "What is the cause of the problem?

"What should I do if there is a problem?

. Practice asking analytical questions... The scope of related questions must lead to the distribution

of elements and find rational relationships in the analysis. The question line will be in the scope.

"5W 1H"... Who (who) .. What (what) .. Where (where) . When (when) .. Why (why) ... How

(how)

On such understanding

- Let students design their own critical thinking guidelines.

The concept of entrepreneurship

- The history of entrepreneurship

The concept of entrepreneurship has evolved from the concepts and theories of 4 disciplines, namely economics, behavioral sciences and sociology,

- psychology and management, that is, economists study and develop the concept of entrepreneurship in terms of the role of economic development. Entrepreneurship will be linked to the establishment of business and the creation of new economic activities, which will affect the development of economic development in the area. Behavioral scientists are interested in studying the characteristics and leaders with the prestige of entrepreneurs who will lead to change. And psychologists study the personality of entrepreneurs who like risk and want to succeed, control and decision- making freedom. Management scholars help make a new business development process to have more effective development activities or procedures.

Entrepreneurship (Entrepreneurship) refers to the process that starts from

1) Initiative to create new ideas

2) Gathering economic and social resources to achieve the desired business or new products.

3) Acceptance of risks or potential failures

- Timmons (1990: 5) said that entrepreneurship

refers to the process of creating or seeking opportunities and making them happen. Although it may not be able to control all available resources, being an entrepreneur involves giving meaning or ideas,

and values to individuals, organizations, and commanding.

- Hisrich et al. (2008: 8) gives the definition ofent repreneurship from a broader perspective and covers many professional fields that it means the process of eating new valuable things that come from dedication, time and diligence. and ready to receive nancial Psychological and social potential as wells receiving returns in the form of money, personal atisfaction and freedom of thought

From that meaning

- For students, what does entrepreneurship mean?
